Unsatisfactory project execution

Dear sir,

I am writing to express my disappointment with the work you have provided for our recent project. Despite our clear expectations and agreements, the quality of service has fallen short of what was promised.

Specifically, poor communication, missing deadlines, shoddy work. These issues have resulted in additional costs and delays for our company, which we had not anticipated.

We understand that mistakes can happen, but we expect a higher level of professionalism and dedication from our contractors. Therefore, we request that you take immediate action to address these concerns and improve the quality of your work.

Although we acknowledge that mistakes do occur, we nonetheless demand more commitment and professionalism from our contractors. We therefore ask that you act right away to address these issues and raise the caliber of your work.

We suggest increased communication, revised timelines, and improved workmanship. We also reserve the right to consider termination of the contract and seek a refund or request that you bear the cost of any necessary additional works.

We hope that you will take this matter seriously and take prompt action to rectify the situation. We would appreciate a detailed plan of action within the next two weeks.

Sincerely

Isuru de silva,

The pie charts below show the comparison of different kinds of energy production of Australia in two different years. so in 1995 production of coal is 29.80% and it is the most produced energy. in the same way in 2005 30.93% of coal were produced. The most important information demonstrated in the charts is that coal was the main source of energy production in Australia in both years.

Both years, natural gas was the second-largest source of energy production, but from 1995 to 2005, its percentage of overall energy production climbed from 29.63% to 30.31%. Between 1995 and 2005, the proportion of other energy generating methods, such as nuclear and petroleum, was largely stable.

The growth of renewable energy sources is due to a few factors, including government policies that support renewable energy, the falling cost of renewable energy technologies, and the increasing public awareness of the environmental benefits of renewable energy.

And the same way the least produced energy is nuclear energy, we can think it's because the high cost. Overall, the pie charts show that there has been a shift in the sources of energy production in Australia from coal to natural gas and renewable energy sources. This shift is likely to continue in the future as Australia strives to reduce its reliance on fossil fuels and meet its climate change targets.
